

Quick Guide

Upload the “upload” folder to your hosting space.

Your hosting domain must have access to your Xtream UI Host IP address. If your hosting space is not authorized, you can contact your hosting company and have them access your Xtream UI host IP address. If they do not have access, you can purchase from the hosting packages on our website.

The install.php file will run automatically when you log in to your website.

Enter the information requested from you in the install script. When the installation is completed, delete the install.php file.

Use /admin.php to log in to your admin page.

All your customers on the Xtream UI can log in to your user interface page by entering their information. Customers of your dealers can also use your customer interface page. When your resellers' customers log in, they will view those DNS if you have defined their DNS.

The categories on the content editing page are bouquets in your Xtream UI panel. Setting your bouquets by country will offer your customers the right to open and close the categories they wish.

If you mark your customers who do not want to use the content editing page as "Restreamer" from your Xtream UI panel, they will not be able to use the content editing page and will encounter a warning.

They can watch live broadcasts from the WebTV section. However, since browsers do not play mkv format, they cannot use the select-watch archive stably. Therefore, there is a warning in the WebTV section.

For the security of your broadcasts (screen-share), the WebTV section is closed to testers. When test users enter the WebTV section, they encounter a warning that they cannot use this section.

The expressions on the installation guides page can be edited separately from the admin page as top and bottom sections. You can change your own expressions on your admin page.

The explanation on the speed test page can be changed from the "Pages" menu on your admin page.

From your admin page, you can create packages and have the information sent to your customer automatically.

It is enough to enter your information into the script by subscribing to “GatewayAPI” for the automatic test system to work with SMS Verification. With the form you will add to your website, you can create a self-test by sending your users a verification code to their phone numbers and you can ensure that their information is sent both by SMS and by e-mail.

With the Activation (Payment Notification) form that you add to your website, you can let your customers notify their payments and you can automatically send the information of the customer whose order you have approved to be sent to your customer via both SMS and e-mail.

When the test is received, the payment notification is received, the manager is informed by e-mail when the support request is created. For this reason, do not forget to enter your e-mail information during the installation.

The packages you create through the script, the e-mail addresses and phone numbers of the people who receive the packages created with the automatic test system are processed in the Reseller Notes and Admin Notes section of the user in your Xtream UI panel.

For the “I Forgot My Password” section on the user login page, the e-mail address of the user must be written in the “Reseller Notes” section. E-mail addresses must be written in order for your customers who are not created through scripts to use this section.

The language file runs automatically according to the browser language entered. All contents and informative messages can be edited from the language file. You can use the languages folder to organize the language files.
